

# Endangered Elements

## Introduction

The Endangered Elements periodic table slide should be used with some qualification. Information on global reserves and the amounts of various elements on the planet itself are often unclear and subject to secrecy from mining companies and metal traders.

The table aims to highlight the most at-risk elements due to a variety of factors including current use, known scarcity, current recycling, where it comes from and how easily it can be substituted.

Of course no element will be destroyed (although helium is lost through the atmosphere to space) but dispersed widely through the environment (2<sup>nd</sup> law of thermodynamics - entropy). This renders it effectively unobtainable – even to economic forces!

An awareness of these issues is important in designing the uses of all the elements. Many important (future) technological solutions may be shut off, and chemists will lose parts of their toolbox.

# Endangered Elements

## Endangered due to:

- Limited amount on the planet
- Being used in dispersive technologies
- Rapid growth in use due to technology application
- Method of obtaining is disproportionately damaging to environment
- Availability a geopolitical issue (political instability)
- Lack of recycling – technical and/or infrastructure

Serious threat in  
next 100 years

Rising threat from  
increasing use

Limited availability  
future risk to supply

Abundant element

Formed by  
radioactive decay

Insufficient  
information
